360-degree view on costs.

**Breitband
Oberösterreich**

Gives Control.

Makes sense: The use of the Cable^{plus} Add-on **View360** enables Breitband Oberösterreich to make a more accurate rough cost estimate for FTTH expansion projects.

PARTNER

BBOÖ Breitband Oberösterreich GmbH is a merger of Fiber Service OÖ with the FTTH division of Energie AG Oberösterreich Telekom GmbH. We have thus bundled our power and can now accelerate fiber optic expansion with concentrated competence and supply Upper Austria with ultra-fast Internet. To make this possible, we provide both the passive and the active infrastructure - in other words, everything from empty conduits and fiber optic cables to network and line connections and transmission technology.

„We really love the implementation in Rimo and the possibilities, and our tech Rimo geeks put on a big grin when we went through the first videos.“

Martin Altmaninger, IKT-Consultant

CHALLENGES

The unsatisfactory process before was as follows:

A highly qualified employee drove into the area with a paper plan and noted on it the possible route types and paths.

This information then either did not find its way into the Rimo system at all or only after considerable delay and, moreover, was not continuous, consistent and thus usable.

SOLUTION & BENEFITS

Due to the View360 Add-On, a single car driver with a short HowTo briefing of the corner points can now cover several areas in one day. This increases efficiency by a factor of about 5.

Breitband Oberösterreich thus benefits from reduced resource requirements and better documentation of routes in Rimo for rough costing. This enables more accurate cost estimates and brings with it associated benefits.
